

The best and only part of this that I can agree with is giving all lic holders under the general class the full priv in the 10m band. And at 100w will in most cases get them all around the world. And because they dont have the code they would have to stay out of the CW area. The only thing the FCC would have to do is ammend all the tech lic to allow for 10m only and then keep the 5wmp code test for all others. This I beleve would keep those that want to keep code happy and those lower lic will have some HF. I would also keep the power output to 200w as that is what the novice class can use in the sub-bands. This would keep the work load down for the FCC as there would be no more paper work just a re-alignment. Thank you.
